Intel® platforms for tablets deliver the Windows* 8 advantage

The development of Microsoft* Windows* 8 and Intel® platforms for tablets represents the latest achievement in a decade long history of collaborative co-engineering. Together, the two companies have carefully tuned their products to deliver an unmatched user experience.

Tablets based on Intel® processors running Windows 8 have far more extensive capabilities for both consumer and business use than the competing tablets in the market.

Run applications and other software you depend on, without compromise

Select from an unparalleled ecosystem of more than four million applications that run on Windows based devices powered by Intel. Intel platforms support the varying demands of these applications, enabling an excellent user experience for different workload sizes. For example, users of processor-intensive software such as Adobe Photoshop* and Adobe Director*, and high-end games should opt for tablets based on Intel® Core™ vPro™ processors or Intel® Core™ processors, while those with more modest needs, such as social media, watching YouTube* videos, and casual games, should go for Intel® Atom™ processor-based tablets.

Mapping task requirements to the right Intel platform-based tablet

Based on whether a user wants a tablet for personal use, for work, or both, they can choose the Intel processor that best meets their specific needs. Both platforms deliver a compelling Windows* 8 user experience with great responsiveness and seamless downloads, support the applications users depend on, and operate smoothly on corporate networks.

For users with rigorous performance requirements for tasks such as demanding productivity applications and content creation, and for those who have advanced security needs, Intel Core vPro processors or Intel Core processors are typically the right choice. Because Intel Atom processors are optimized for portability and long battery life, they may be preferred by users who place a premium on mobility and whose typical tablet use includes light productivity applications and content consumption.

Select the best tablet to match your needs

Intel® architecture-based tablets have emerged as a flexible choice for either consumer or business use, and they are equally well suited to a combination of the two. Intel architecture-based tablets help deliver the full potential of the Windows* 8 experience. This combination of hardware and OS offers brilliant and immersive user experiences with beautiful visuals, great responsiveness, and seamless downloads.

With support for the entire software ecosystem built for Windows, these devices offer extraordinary performance, battery life, responsiveness, and security. The fundamental distinctions between the two hardware platforms are as follows:

- **Tablets based on Intel® Core™ vPro™ and Intel® Core™ processors** are optimized for performance and security. They are well suited to content consumption and creation. In addition, Intel® Core™ vPro™ processors deliver security and manageability advantages for business users.
- **Tablets based on Intel® Atom™ processors** are optimized for portability and long battery life. They are better suited for content consumption than creation.

Intel® Xeon® Processor E5-4600 Product Family

The Advantages of 4-Socket Servers

The Intel® Xeon® processor E5-4600 product family provides up to 1.88x greater performance² and up to 52 percent 4-year Total Cost of Ownership (TCO) estimated advantage³ compared to the 2-socket servers based on the Intel® Xeon® processor E5-2600 product family. Data centers looking for ways to improve performance, reduce costs, and make maximum use of floor space now have a clear and compelling choice for new server purchases and refreshes.

One solution, multiple advantages

Based on a new Intel® microarchitecture and Intel's leading-edge 32nm process technology, the Intel® Xeon® processor E5-4600 product family provides a density- and cost-optimized 4-socket processor solution to extend the value of the Intel® Xeon® processor E5 family to 4-socket servers.

Excellent performance scaling

Compared to the Intel® Xeon® processor E5-2600 product family, the Intel® Xeon® processor E5-4600 product family doubles the processors, memory (48 DIMMs supporting up to 1.5 TB), and I/O (160 lanes of PCIe 3.0 based on 40 lanes per socket) for maximum capacity.

Achieve the right balance of performance and price

By using fewer servers to deliver equivalent performance, the Intel Xeon processor E5-4600 product family provides the following TCO advantages:

- Less server hardware to buy
- Reduced infrastructure and utilities costs. Factors reducing these costs include:
 - Fewer servers to power and cool
 - Excellent energy efficient performance
 - Up to 75 percent better density at rack level,^{4,5} which saves valuable rack/floor space
- Fewer servers to maintain, which translates into lower maintenance costs
- Fewer operating system (OS) licenses to purchase and maintain

Software and workloads used in performance tests may have been optimized for performance only on Intel microprocessors. Performance tests, such as SYSmark and MobileMark, are measured using specific computer systems, components, software, operations, and functions. Any change to any of those factors may cause the results to vary. You should consult other information and performance tests to assist you in fully evaluating your contemplated purchases, including the performance of that product when combined with other products.

Performance tests and ratings are measured using specific computer systems and/or components and reflect the approximate performance of Intel products as measured by those tests. Any difference in system hardware or software design or configuration may affect actual performance. Buyers should consult other sources of information to evaluate the performance of systems or components they are considering purchasing. For more information on performance tests and on the performance of Intel products, visit www.intel.com/performance/resources/limits.htm.
